

Industrial/Pollution Wiki

1. a brief description of the purpose of the component

The purpose of the industrial component is to assign workers from residential and create goods for commercial nodes. Industrial also creates pollution in accordance to population and then spreads to adjacent nodes by a factor of -1.

2. a description of how data was stored and maintained for this component,

Although I was not able to implement it, the idea was to make nodes and then implement them into an array so that the information can be read into the simulation. Although I had pseudocode for the processes. Without a proper header and adjacency array I was not able to implement anything I wanted to create.

3. and a description of the functionality for the component.

There was no functionality able to be implemented
